

Climbers triggered this very small wind slab on the way to a climb up Flanders in Hyalite (11/11). A tiny slide to a skier can be bad news for a climber since losing one's balance or getting pushed off a cliff can be deadly. From an email (edited):

Hyalite Snow Conditions:...we dug two hasty pits on east facing slopes in Flanders.... 8200'- isolated opening in trees in an area on rocks, shallower snow (~50cm). CT12 at the ground, again just tapping on the back of other hand, so not super legit, but did raise eyebrows. 8450'- Opening below cliff bands on exposed traverse. Deeper

snow (~80-90cm). No concerns other than storm snow and snow coming off of cliff bands. Classic Hyalite shifty winds. We released a small (10-15cm) storm slab on traverse into the climb . Weather: It was snowing and blowing all day.
