

Barronette

Date

Mon, 12/07/2020 - 21:55

Up to the summit of Barronette today. We once again observed a very thin and weak snowpack. This is in stark contrast to Cooke just a few miles down the road! Solar aspects have crusts and faceted snow, shady aspects are entirely faceted and weak enough that facet sluffing occurred on steeper slopes. HS between 10 and 75 cm.
