

Large avalanche on Bridger Peak

Bridger Peak
Bridger Range
3/27/2023
Code
N
Elevation
10000
Aspect
E
Latitude
45.77010
Longitude
-110.94000
Notes

Two large, widely [propagation](#) fractures visible through a hole in the cloud cover Monday A.M. from Bridger Canyon Dr. Upper [slab](#) failure evidently stepped down to a deeper layer estimated 400' below upper crown. Both crowns appeared to be similar depth. Also visible were debris toes further to the North that had run mostly full path. Looked like it was already covered up yesterday (tues).

A second ob via phone message:

A large natural avalanche occurred on the north summit of Bridger Peak yesterday (Monday, 27 March). The crown line was complex.

Number of slides
1
Number caught
0
Number buried
0
Trigger
Natural trigger
Problem Type
Persistent Weak Layer
Snow Observation Source
[Large propagating fractures upper E flank of Bridger Peak 3/27](#)
Slab Thickness units
centimeters
Single / Multiple / Red Flag
Single Avalanche
Advisory Year
[22-23](#)
