

Lower Hyalite

Date

Wed, 02/12/2025 - 12:35

Activity

Skiing

Explored slopes in lower Hyalite Canyon between 6000-7000 ft in elevation. Really close to being skiable and good. Otherwise, we found snow depths ranging from 6 inches to 2 feet. Generally very weak and faceted with thick crusts on slopes with a southerly tilt. All this weak snow probably won't be an issue because this area only gets the scraps from storms and never has enough [loading](#) to make an avalanche problem.

Region

Northern Gallatin

Location (from list)

Hyalite - main fork

Observer Name

Staples & Darby
